

# Chapter Three

## Preferences

1

## Preferences

- Behavioral Postulate:
  - A decisionmaker always chooses its most preferred alternative from its set of available alternatives.
- So to model choice we must model decisionmakers' preferences.

2

## Preference Relations

- Comparing two different consumption bundles, **x** and **y** (**why bold?**):
  - strict preference: **x** is more preferred than is **y**.
  - weak preference: **x** is as at least as preferred as is **y**.
  - indifference: **x** is exactly as preferred as is **y**.

3

## Preference Relations

- Strict preference, weak preference and indifference are all preference relations.
- Particularly, they are **ordinal** relations; *i.e.* they state only the order in which bundles are preferred.
- What does ordinal mean?

4

## Preference Relations

- $\succ$  denotes strict preference so  $\mathbf{x} \succ \mathbf{y}$  means that bundle  $\mathbf{x}$  is preferred strictly to bundle  $\mathbf{y}$ .
- $\succeq$  denotes weak preference;
- $\mathbf{x} \succeq \mathbf{y}$  means  $\mathbf{x}$  is preferred at least as much as is  $\mathbf{y}$ .

5

## Preference Relations

- $\sim$  denotes indifference;  $\mathbf{x} \sim \mathbf{y}$  means  $\mathbf{x}$  and  $\mathbf{y}$  are equally preferred.
- $\mathbf{x} \succeq \mathbf{y}$  and  $\mathbf{y} \succeq \mathbf{x}$  imply  $\mathbf{x} \sim \mathbf{y}$ .
  - $\mathbf{x} \succeq \mathbf{y}$  and (not  $\mathbf{y} \succeq \mathbf{x}$ ) imply  $\mathbf{x} \succ \mathbf{y}$ .

6

## Assumptions about Preference Relations

- **Completeness:** For any two bundles  $\mathbf{x}$  and  $\mathbf{y}$  it is always possible to make the statement that either
$$\mathbf{x} \succsim \mathbf{y}$$
or
$$\mathbf{y} \succsim \mathbf{x}.$$
- Or both, which means indifference.
- Thus, we can say we assume that we are able to have preferences over bundles.

7

## Assumptions about Preference Relations

- **Reflexivity:** Any bundle  $\mathbf{x}$  is always at least as preferred as itself; *i.e.*

$$\mathbf{x} \succsim \mathbf{x}.$$

8

## Assumptions about Preference Relations

- **Transitivity** (consistency): If  $\mathbf{x}$  is at least as preferred as  $\mathbf{y}$ , and  $\mathbf{y}$  is at least as preferred as  $\mathbf{z}$ , then  $\mathbf{x}$  is at least as preferred as  $\mathbf{z}$ ; *i.e.*

$$\mathbf{x} \succsim \mathbf{y} \text{ and } \mathbf{y} \succsim \mathbf{z} \Rightarrow \mathbf{x} \succsim \mathbf{z}.$$

- Complete + Reflexive + Transitive is sometimes referred as **rational** preferences. Are they reasonable?

9

## Indifference Curves

- Take a reference bundle  $\mathbf{x}'$ . The set of all bundles equally preferred to  $\mathbf{x}'$  is the indifference curve containing  $\mathbf{x}'$ ; the set of all bundles  $\mathbf{y} \sim \mathbf{x}'$ .

10

## Indifference Curves

11

## Indifference Curves

12

## Indifference Curves

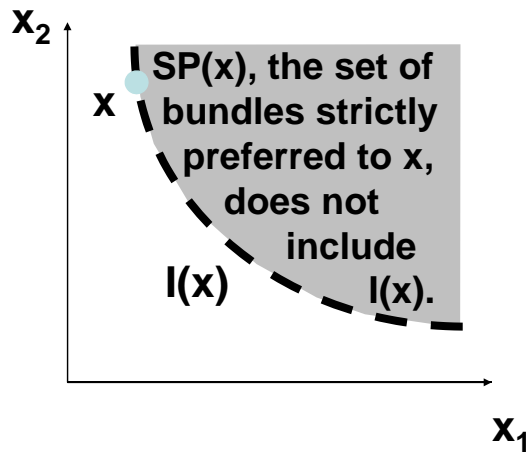

13

## Indifference Curves

14

## Indifference Curves

15

## Indifference Curves Cannot Intersect

16

## More Assumptions

- When I wrote most likely above we saw the contradiction came from the fact that bundles were not on the same indifference curve.
- However to state  $y \succ z$ , we need to add the assumption that more is better, which is called *monotonicity* or monotonic preferences. (See below)

17

## Slopes of Indifference Curves

- When more of a commodity is always preferred, the commodity is a *good*.
- If every commodity is a good then indifference curves are negatively sloped.

18

## Slopes of Indifference Curves

Good 2

Two goods ➡  
a negatively sloped  
indifference curve.

19

## Slopes of Indifference Curves

- If less of a commodity is always preferred then the commodity is a *bad*.

20

## Slopes of Indifference Curves

Good 2

One good and one bad ➡ a positively sloped curve. But treat a bad as absence of bad to get downwards sloping curves again

21

## Extreme Cases of Indifference Curves; Perfect Substitutes

- If a consumer always regards units of commodities 1 and 2 as equivalent, then the commodities are **perfect substitutes**
- Only the total amount of the two commodities in bundles determines their preference rank-order.
- Examples Coke and Pepsi cola (for some at least)

22

## Extreme Cases of Indifference Curves; Perfect Substitutes

23

## Extreme Cases of Indifference Curves; Perfect Complements

- If a consumer always consumes commodities 1 and 2 in fixed proportion (in this example, one-to-one), then the commodities are **perfect complements**
- Only the number of pairs of units of the two commodities determines the preference rank-order of bundles.
- Example: left and right shoes

24

## Extreme Cases of Indifference Curves; Perfect Complements

25

## Preferences Exhibiting Satiation

- A bundle strictly preferred to any other is a **satiation point or a bliss point**.
- What do indifference curves look like for preferences exhibiting satiation?
- Example: ounces of ice cream within an hour having no freezer available

26

## Indifference Curves Exhibiting Satiation

27

## Indifference Curves for Discrete Commodities

- A commodity is **infinitely divisible** if it can be acquired in any quantity; e.g. water or cheese.
- A commodity is **discrete** if it comes in unit lumps of 1, 2, 3, ... and so on; e.g. aircraft, ships and refrigerators.

28

## Well-Behaved Preferences

- A preference relation is “well-behaved” if it is
  - **monotonic** and **convex**.
- **Monotonicity**: More of any commodity is always preferred (*i.e.* no satiation and every commodity is a good or absence of bad).

29

## Well-Behaved Preferences

- **Convexity**: Mixtures of bundles are (at least weakly) preferred to the bundles themselves.
- E.g., the 50-50 mixture of the bundles  $x$  and  $y$  is  $z = (0.5)x + (0.5)y$  and then we assume  $z$  is at least as preferred as  $x$  or  $y$ .
- We can think of this as taste of diversification or aversion against extreme bundles

30

## Well-Behaved Preferences -- Convexity.

31

## Well-Behaved Preferences -- Convexity.

32

## Well-Behaved Preferences -- Convexity.

33

## Well-Behaved Preferences -- Weak Convexity.

34

## Non-Convex Preferences

35

## More Non-Convex Preferences

36

## Slopes of Indifference Curves

- The slope of an indifference curve is its **marginal rate-of-substitution (MRS)**.
- This measures at which rate at which the consumer is willing to trade a tiny bit of one good for little more of the other. **I.e. while being indifferent, staying on the same indifference curve**
- How can a MRS be calculated?
- Naturally it must be the **slope** of the curve

37

## Marginal Rate of Substitution

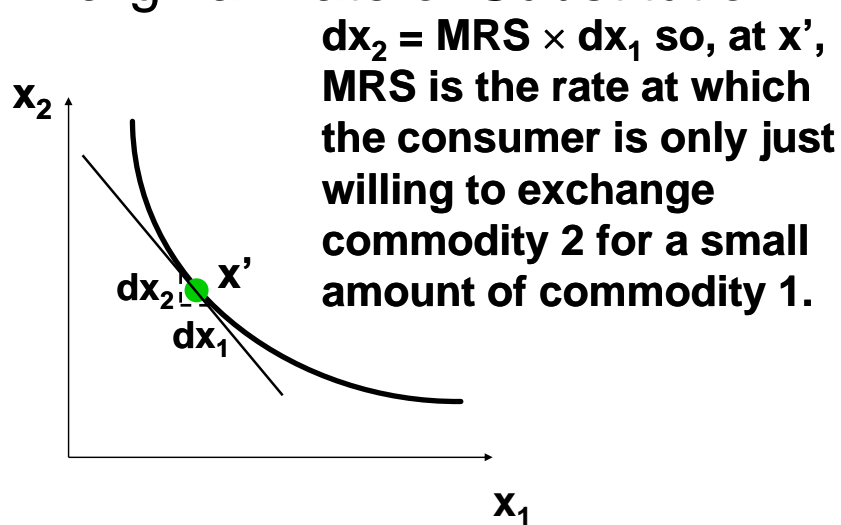

38

## Marginal Rate of Substitution

39

## Marginal Rate of Substitution

40

## Normal MRS & Ind. Curve Properties

Good 2

Two goods ➡  
a negatively sloped  
indifference curve

➡  $MRS < 0$ .  
Why ?

Good 1

41

## Normal MRS & Ind. Curve Properties

Good 2

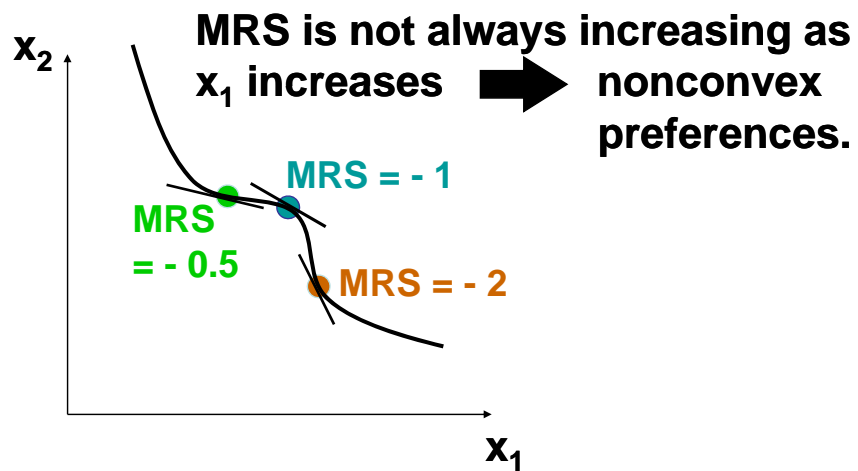

$MRS = - 5$   
 $MRS$  always increases with  $x_1$   
(becomes less negative) if and  
only if preferences are strictly  
convex. Intuition?

$MRS = - 0.5$  Good 1

42

## Fishy MRS & Ind. Curve Properties

43
