Localised Wannier functions in metallic systems.

David Gontier, CEREMADE

Abstract: The construction of exponentially localised Wannier functions is well understood for insulators, but the case of metallic systems has been much less explored. In this talk, we show that \( N \) energy bands of a metal can be exactly represented by \( N + 1 \) Wannier functions decaying faster than any polynomial. This is joint work with H. Cornean, D. Monaco and A. Levitt.
